

# "Port Credit Lighthouse Gets a Facelift With Ecoglo"

## Ecoglo At Work

### Port Credit Lighthouse chooses Ecoglo

The City of Mississauga has given the Port Credit Lighthouse a facelift this summer.

*"The Port Credit Lighthouse facility is one of the most recognizable landmarks in Mississauga and a focal point for the Port Credit community," said Andrew Mills, project co-ordinator. "The facelift is part of the building's natural life cycle maintenance and will address current functional, safety and accessibility deficiencies to improve the longevity of the building."*

As part of the facelift, the outside stairs were improved by the addition of Ecoglo stair nosings. Slips and falls are a problem, especially in inclement weather or at night, and the Ecoglo stair nosings ensured that the stairs remain safe in any condition.

Ecoglo products feature a built-in photoluminescent strip made up of crystals in a pigment that absorb light from both solar and artificial sources. The luminescent strips quickly become charged and emit a steady green glow. Ecoglo's emergency lighting technology requires no maintenance making it superior in durability. It easily withstands continuous foot traffic and weathering as opposed to other egress systems.

This world leading emergency lighting technology is being used in facilities around the world. Emergency lighting products made using Ecoglo technology include step nosings, handrail markers, signage and pathway markers. Ecoglo enables the efficient movement or evacuation of people around or out of any commercial, residential, institutional or industrial building. Ecoglo is available for both indoor and outdoor installations.
